(54) Title: NOVEL ANTIVIRAL AGENTS

(57) Abstract

Phosphonate analogues of mono-, di-, and triphosphates of antiviral nucleoside analogues. These materials are represented structurally as formula (1), wherein Z1 and Z2 are the same or different and selected from the group made up of hydrogen, the one to six carbon alkyls, phenyl and benzyl, X is H, OH, or together with Y = O, Y is H or together with X = O, n is an integer, 0, 2 or 4, R₁ and R₂ together complete a β-pentofuranose sugar or R₁ is H and R₂ is H or -CH₂OH, R₃ is H or OH and B is a pirine or pyrimidine base. These materials have antiviral activity, expecially against herpes virus. Antiviral pharmaceutical preparations and their use are disclosed as well.

NOVEL ANTIVIRAL AGENTS

Field of the Invention

This invention concerns nucleotide analogues and their synthesis and use. More particu5 larly, it concerns phosphonic acid analogues of
natural and synthetic nucleoside phosphates and their
preparation and use as antiviral agents.

Background of the Invention

There is a recognized need for antiviral agents. Herpes virus hominis alone infects between 50 and 150 million Americans at this time. A number of the antiviral agents that are currently viewed as most effective against herpes are nucleoside analogues.

These materials include iododeoxyuridine, 2-hydroxy-

- ethoxymethylguanine, 2'-fluoro-5-iodo-1-arabinofuranosyl cytosine and 5-E-bromovinyldeoxyuridine. It is believed that these materials act through their conversion by viral thymidine kinase (but not by host TK) to the nucleotide which is then converted to the
- triphosphate and incorporated into viral DNA. The incorporation of these analogues into the viral DNA prevents its replication and thus is lethal to the virus. Two shortcomings of this antiviral mechanism have been recognized, however. First, thymidine
- 25 kinase negative herpes mutants (TK⁻) have been identified which are inherently inactive toward phosphorylating these analogues and thus permitting their incorporation in viral DNA. In addition, TK⁺ mutants that are resistant to 2-hydroxyethoxymethyl-
- 30 guanine have been reported in mice by H. Field, et al, in <u>J Infect Dis</u>, <u>143</u> 281 (1981). TK⁺ mutants resistant to iododeoxyuridine have been reported in

humans by A. Hirano, et al, in <u>Acta Virol</u> 23 226 (1979). It may be that these newly-discovered resistant viral strains do not undergo the monophosphorylation or triphosphate formation needed to permit incorporation in the DNA.

References to these antiviral agents of the art and their use include Am J Med, 73 No 1A, July 20, 1982 "Proceedings of a Symposium on Acyclovir";

Biochem Biophys Acta, 32 295-6 (1959); Antimicrob

10 Agents Chemother, 578-584 (1965); Science, 145 585-6 (1964); Science, 255 468-80 (1975); J Med Chem, 19

495-8 (1976); Proc Natl Acad Sci, 76 4415-18 (1979); and J Med Chem 22 21-24 (1979).

The present invention provides antiviral 15 materials which can be lethally incorporated into DNA without the dependence upon enzyme-moderated phosphorylation. The materials of the invention are phosphonate analogues of the mono-, di- and triphosphates of the deoxynucleotide analogs. An article by Robert

20 Engel appearing at <u>Chem Reviews</u>, <u>11</u>, #3 pp 349-367 (1977) discusses phosphonate analoges of nucleotides and the like. Other representative references in this area, some of which are cited in the <u>Chem Reviews</u> article, are German O.L.S 2,350,608 (1974) of Syntex 25 (Jones and Moffatt inventors); German O.L.S. 2,009,834 1970 also of Syntex with Jones and Moffatt as inventors; British Patent 1,243,214 of Syntex, and US

Statement of the Invention

Patent 3,560,478 of Myers.

A group of new materials have now been found. These materials in a broad sense are phosphonate analogues of mono-, di-, and triphosphates of antiviral nucleoside analogues. These analogues

request there intents. *

differ from nonlethal natural nucleosides by variations in their sugar ribose moiety and/or by variations in their nucleoside base moieties. Such materials are represented structurally as

wherein Z_1 and Z_2 are the same or different and selected from the group made up of hydrogen, the one to six carbon alkyls, phenyl and benzyl, X is H, OH, or together with Y = 0, Y is H or together with X = 0, n lois an integer, 0, 2 or 4, R_1 and R_2 together complete a β -pentofuranose sugar or R_1 is H and R_2 is H or -CH₂OH, R_3 is H or OH and B is a purine or pyrimidine base.

In other aspects this invention relates to 15 the preparation of these materials, their formulation into antiviral pharmaceutical compositions and the use of these formulations to treat viral infections, in particular herpes infections.

Detailed Description of the Invention

20 The compounds

The compounds of this invention are phosphonates which have the structure set forth above in Statement of the Invention.

The unit defines an antiviral nucleoside.

As previously noted, in this structure R_1 and R_2 can together complete a β -pentofuranose sugar. In this configuration they preferably complete a substituted or unsubstituted β -ribofuranose or β -arabinofuranose such as ribose, 2-deoxyribose, 2,3-dideoxyribose, 3-deoxyribose, 2-fluoro-2-deoxyribose or arabinose or the like.

In this structure, Z₁ and Z₂ preferably are each selected from hydrogens and one to four carbon alkyls. More preferably Z₁ and Z₂ are each hydrogens. Further in this structure, the integer n is significant in defining whether the compound is in size equivalent to a nucleoside monophosphate, a diphosphate or a triphosphate.

Preferred bases include guanine, adenine, 5-iodouracil, 5-trifluorothymine, 5-iodocytosine, E-5-2-bromovinyluracil, 5-propyluracil, and 5-ethyluracil.

20 Preferred nucleoside analogues (e.g.

include 5-iodo-2'-deoxyuridine, 9-B-D-arabinofurano-syladenine, 5-trifluorothymidine, E-5-(2-bromoviny1)-2'-deoxyuridine, 1-(2'-deoxy-2'-fluoro-B-D-arabino-

furanosyl)-5-iodocytosine, 5-ethyl-2'-deoxyuridine, 5-propyl-2'-deoxyuridine, 9-(2-hydroxy-ethoxymeth-yl)guanine, 9-(ethoxymethyl)guanine, 9-(2-hydroxy-ethoxymethyl)adenine and 9-(ethoxymethyl)adenine.

These nucleoside analogues yield phosphonates (and di- and triphosphate-phosphonate analogues) having the following general structures

$$z_{10} = z_{10} = z$$

wherein X, Y, Z_1 , Z_2 , B, R_1 , R_2 and R_3 are as described above. In preferred embodiments, X is hydrogen or hydroxyl and Y is hydrogen. Thus, representative compounds can have the structures shown in Table I.

These are merely representative compounds as it will be apparent to those skilled in the art that other combinations of substituents and bases could be employed as well.

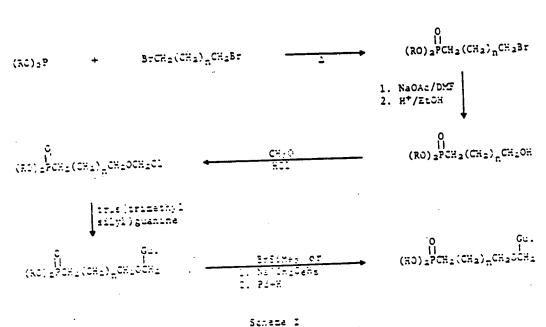

Preparation

15

20

The compounds of this invention can be prepared by the following general procedures: The non β -pentofuranose materials such as materials having structures 1, 2, 12, 13, 20, 21, and 22 in Table I can be made with the representative reaction sequence I.

I.

In this sequence, a trialkyl (C₂, C₄ or C₆) phosphite reacts with a dibromoalkane in an Arbuzov reaction to give the bromoalkyl phosphonate (See <u>J Am Chem Soc</u>, <u>87</u> (2), 253 (1965)). (All cited references are incorporated herein).

Displacement of the bromide using sodium acetate in DMF followed by hydrolysis of the acetate ester gives diethyl 3-hydroxypropylphosphonate (i.e. in sequence I, $R=C_2H_5$, n=1). This material is chloromethylated to the chloromethylester and then reacted with a suitably protected base such as tristrimethylsilylguanine by the method of Kelley, et al,

J Med Chem. 24 1523 (1981). This yields the phosphono product, e.g. 9-(3-phosphonopropyloxymethyl)guanine, directly. Phosphonate esters are smoothly cleaved by bromotrimethylsilane to the phosphonic ester by the method of McKenna, et al, Tet Letts, 155 (1977).

The syntheses of a representative deoxy-riboside is illustrated in Scheme II.

5

10

15

20

25

30

Oxidation of 2',3'-0-isopropylidine-5propyluridine (1) by the Moffatt procedure, Pfitzner
and Moffatt J Am Chem Soc, 85 3027 (1963) will yield
the 5'-aldehyde. The reaction of (2) by the Wittig
reagent prepared as shown in Scheme (2) gives the
chain-extended, unsaturated "nucleotide" (4). Hydrogenation and deacetonation of the nucleotide (4) will
give the partially unblocked nucleotide (5).

The conversion of the riboside (5) to the deoxyriboside (7) is accomplished by a strategy described recently by Lessor and Leonard, J Org Chem, 46 4300 (1981), which was based on the selective partial deacylation of fully acylated nucleosides outlined by Ishido, et al, J Chem Soc, Perk I, 563 (1980). benzoylation of (5) to the 2',3'-di-O-benzoate followed by treatment with hydroxylaminium acetate in dry pyridine will give the 3'-benzoate (6). Thiobenzoylation of (6) followed by treatment with tributyl tin and debenzoylation using sodium benzyloxide, converts the 2'-hydroxyl to H, deacylates the 3'-0-benzoate, and substitutes the phenyl phosphate ester with benzyl phosphate, Jones and Moffatt J Am Chem Soc, 90 5337 (1968). Hydrogenolysis removes the benzyl ester and gives the desired phosphonic acid (7).

Alternatively, compounds in the 2-deoxyribose series are prepared from the 2'-deoxynucleoside by chemistry outlined in Scheme III. Thus, selective tritylation followed by mesylation of 5-propyl-2'deoxyuridine (1) gives (8), which is converted to the 2,3'-cyclonucleoside (9) using sodium benzoate in DMF (Yung and Fox, J Am Chem Soc, 83 3060 (1961)). Oxidation to the aldehyde (10) followed by a Wittig condensation gives the unsaturated phosphonate (11). Hydrogenation and ring-opening (Yung and Fox) gives the 10 phosphonate ester (7), which can be deblocked, (U.S. Patent 3,524,846 and <u>J Am Chem Soc</u>, <u>90</u> 5337 (1968)) to the free phosphonic acid. Hydroboration of (11) followed by ring mixture of 5'-hydroxy and 6'-hydroxy isomers. 15

Oxygen functionality a to the phosphonate can be introduced by the chemistry outlined in Scheme IV. The appropriate propargyl phosphonic acid (13) can be prepared from tetrahydropyranyl-propargyl alcohol (12) by the procedures outlined by Chattha and Aquiar, J Org Chem. 36 2719-20 (1971). Selective hydrogenation to the vinyl phosphonate followed by the sequence outlined in Scheme IV results in phosphonate analogues with one or two hydroxyls in the phosphonate chain.

$$(RO)_{2}^{0} \xrightarrow{B_{T}(CH_{2})_{n+1}B_{T}} (RO)_{2}^{0} \xrightarrow{P(CH_{2})_{n+1}B_{T}} (RO)_{2}^{0} \xrightarrow{P(CH_{2})_{n+1}P} = \emptyset,$$

BUREAU OMPI WIPO

Carbonyl analogs can be prepared by the chemistry outlined in Scheme V. This method involves Arbuzov reaction of triethylphosphite with 8-acetoxy-propionyl chloride (14) by the method of Yamashita, et al, Bull Chem Soc Japan, 53(6) 1625 (1980).

Scheme V

This gives the α-carbonyl phosphonate ester (15).

Conversion of 15 to the bromoethyl derivative 16

followed by reaction with triphenylphosphine will give the Wittig reagent (17). Condensation of 17 with the appropriate aldehyde (e.g. 10) gives the olefin 18,

which, after hydrogenation and deblocking, results in

the desired product $\underline{19}$, a nucleoside diphosphonate analog. The nucleoside triphosphate analog $\underline{19}$ (wherein n = 3) can be prepared starting from 5-acetoxyvalerylchloride.

The nucleoside monophosphonate analog (20) can be prepared by the chemistry outlined in Scheme VI.

5

10

Scheme VI

Salts

10

Physiologically acceptable salts of compounds of this invention are prepared by methods known in the art. The salts include ammonium salts and salts of physiologically acceptable metals, particularly Li+, K+, Na+, Ca++ and Mg++, and are novel compounds and comprise a further aspect of the invention. Metal salts can be prepared by reacting a metal hydroxide with a compound of the invention. Examples of metal salts which can be prepared in this way are salts containing Li⁺, Na⁺, and K⁺. A less soluble metal salt can be precipitated from a solution of a more soluble salt by addition of a suitable metal compound. Acid salts can be prepared by reacting a compound of the invention with an acid such as HCl, HBr, 15 H₂SO₄, or an organic sulphonic acid.

Pharmaceutical Preparations

The compounds of this invention (including the physiologically acceptable salts thereof) have antiviral activity. They present activity against 20 Herpes Simplex viruses and related viruses for example Herpes Simplex virus I, Herpes Simplex virus II, Epstein-Barr virus, varicella Zoster virus, and cytomegalo virus. Thus the compounds can be formulated into pharmaceutical preparations. Such preparations 25 are composed of one or more of the compounds in association with a pharmaceutically acceptable carrier. The book Remington's Pharmaceutical Sciences, 15th Ed by E.W. Martin (Mark Publ. Co., 1975) discloses typical carriers and methods of preparation, which dis-30 closure is incorporated by reference.

The compounds may be administered topically, orally, parenterally (e.g. intravenously, by

intramuscular injection, or by intraperitoneal injection or the like depending upon the nature of the viral infection being treated.

5

10

15

20

25

30

For internal infections the compositions are administered orally or parenterally at dose levels of about 0.1 to 300 mg/kg, preferably 1.0 to 30 mg/kg of mammal body weight and can be used in man in a unit. dosage form administered one to four times daily in the amount of 1 to 250 mg per unit dose. For oral administration, fine powders or granules may contain diluting, dispersing and/or surface active agents, and may be presented in water or in a syrup, in capsules or sachets in the dry state or in a nonaqueous solution or suspension, wherein suspending agents may be included; in tablets, wherein binders and lubricants may be included, or in a suspension in water or a syrup. Where desirable or necessary, flavoring, preserving, suspending, thickening or emulsifying agents may be included. Tablets and granules are preferred oral administration forms and these may be coated.

For parenteral administration or for administration as drops, as for eye infections, the compounds may be presented in aqueous solution in a concentration of from about 0.1 to 10%, more preferably about 0.1 to 7%. The solution may contain antioxidants, buffers, etc.

Alternatively, for infections of the eye, or other external tissues, e.g. mouth and skin the compositions are preferably applied to the infected part of the body of the patient topically as an ointment, cream, aerosol or powder, preferably as an ointment or cream. The compounds may be presented in an ointment, for instance with a water soluble ointment base, or in a cream, for instance with an oil in water

cream base in a concentration of from about 0.01 to 10%, preferably 0.1 to 7%, most preferably about 0.5% w/v. Additionally, viral infections of the eye, such as Herpetic keratitus may be treated by use of a sustained release drug delivery system as is described in the art.

The exact regimen for administration of the compounds and compositions disclosed herein will necessarily be dependent upon the needs of the individual subject being treated, the type of treatment and, of course, the judgement of the attending practitioner.

The invention will be further described by the following nonlimiting examples.

Example I

Diethyl-3-hydroxypropylphosphonate

Diethyl-3-bromophosphonate (12.0 g, 46 mmol, prepared by the method of Anatol Eberhard and F.H. Westheimer, <u>JACS</u> 87 253-260 (1965)) was stirred with 12.0 g NaOAc·3H₂O in 125 ml DMF heated in a steam bath. The reaction was evaporated to dryness in vacuo after 2 hours and partitioned between H₂O and EtOAc, extracting the aqueous layer five times. The ethyl acetate extract was washed once with brine, dried with

Na₂SO₄. filtered, and evaporated to dryness in vacuo to yield 9.8 g light yellow oil (89%). H NMR (CDCl3) δ 1.3 (tr, 6 H), 1.5-2.0 (m, 4 H), 2.03 (s, 3 H), 4.1 (assym. quintet, 6 H) thin layer chromatography on SiGF developed with 2:1 EtOAc: CH2Cl2 gave Rf 0.30. The isolated diethyl-3-acetoxypropylphosphonate (9.8 g, 41 mmol) in 200 ml abs. EtOH was stirred with 30 ml Dowex 50 (H⁺) which had been rinsed three times each with H_2O and EtOH. After 4-1/2 days at room temperature, another 10 ml of similarly prepared resin 10 was added. Six hours later, the reaction was filtered and evaporated in vacuo. The quantitative yield of yellow oil was purified by dry column chromatography on 400 g silica packed in a 2.75 inch flat diameter nylon tube. The column was eluted with 1:9 MeOH: EtOAc 15 and the appropriate fractions were cut and slurried with 1:1 MeOH: EtOAc. Filtration and evaporation in vacuo afforded 5.33 g (66%) pale yellow oil. H NMR (CDCl₃ D₂O): δ 1.30 (tr, 6 H), 1.60-2.08 (m, 4 H), 3.67 (tr, 2 H), 4.13 (quintet, 4 H); thin layer chro-20 matography on SiGF developed with 1:9 MeOH: EtOAc gave an R_f of 0.57.

9(3-phosphono-1-propyloxymethyl)guanine

To 9.40 mmol silated guanine (James L. Kelley, Mark P. Krochmal, and Howard J. Shaeffer, J Med Chem, 24 1528-1531 (1981)) in 9 ml dry toluene was added 7.60 mmol diethyl-3-chloromethoxypropylphosphonate, prepared from diethyl-3-hydroxypropylphosphonate according to the procedure of Kelley, et al, followed by the addition of 2.2 ml triethylamine. The reaction was refluxed 24 hours and evaporated to dryness in vacuo. The residue was digested with 70 ml EtOH and the voluminous tan solid was isolated by suc-

tion filtration. The solid was dissolved in water, made basic with conc. NH_AOH , and treated with excess aqueous lead diacetate. The lead salt was isolated by centrifugation and dissolved in 50% acetic acid followed by treatment with H2S for 20 minutes. The black lead sulfide was removed by suction filtration through Celite. The filtrate was evaporated to dryness in vacuo, triturated in EtOH, and filtered. The residue was further triturated in DMF and filtered to yield 320 mg off-white solid. This solid was dissolved in 10 minimum water, acidified with 1 M HCl. Thereafter it was neutralized with 1 M NaOH and lyophilized. solid residue was triturated in a mixture of DMF, H2O, and EtOH and filtered to yield 276 mg of 9(3-phosphonc-1-propyloxymethyl) quanine as a white solid 15 (8.3%). Anal. $(C_9H_{12}N_5O_5P \cdot 2Na \cdot 5H_2O)$ C, H, N; UV γ_{max} (ϵ): pH 1, 255 (14, 700); pH 7, 251 (15, 600); pH 11, 257 (12, 800), 267 (12, 800); mass spectrum (TMS derivative) m/e 591 (M $^+$ of TMS $_4$ derivative); 1 H NMR $(D_2O):$ 5 1.25-1.90 (m, 4 H), 3.42 (tr, 2 H), 5.50 (s, 20 2 H), 7.92 δ (s, 1 H). Thin layer chromatography on SiGF developed with 7:3 CH3CN:0.1 N NH4Cl gave R_f 0.20.

Example II

5 6-Chloro-9(3-diethylphosphono-1-propyloxy-methyl)guanine

10

To 0.5 g (2.95 mmol) 2-amino-6-chloropurine, silated and treated with Hg(CN)₂ according to the procedure of Robins and Hatfield (Morris J. Robins and Peter W. Hatfield, <u>Can J Chem</u>, <u>60</u> 547-553 (1982)) in 40 ml benzene was added a solution of 2.68 mmol

diethyl-3-chloromethoxypropylphosphonate prepared from (0.525 g) diethyl-3-hydroxypropylphosphonate according to the procedure of Kelley, et al, (James L. Kelley, Mark P. Krochmal and Howard J. Shaeffer, J Med Chem, 24 1528-1531 (1981)). The reaction was refluxed for 2 hours, cooled and 400 ml $CHCl_3$ was added. The organic phase was washed successively with 80 ml each of aqueous saturated $NaHCO_3$ and 1 M aqueous KI. The organic solution was dried over Na2SO4, filtered and evaporated to 790 mg of yellow gum. A portion of this crude 10 material was used to conduct hydrolysis experiments. The remaining material was chromatographed on a silica column. A solution of 574 mg of the crude reaction product was placed on 20 g silica packed in a column using 5:3 EtOAc:nPrOH. Elution with the same mixed 15 solvent afforded sixteen fractions of 10-20 ml each. Fractions 7-12 were combined to yield 258 mg of a colorless oil which spontaneously crystallized. Trituration in CH2Cl2 Et2O afforded two crops of white solid (207 mg), mp 109-110° (28%). A yield of 46% was 20 obtained from a reaction performed on 45.2 mmol of the starting purine. Anal (C₁₃H₂₁ClN₅O₄P) C₁H₁N; UV Y_{max} pH 1, 246 (ε 6600), 310 (7200); pH 7, 247 (6800), 308 (7400); pH 11 247 (6600), 308 (7100); mass spectrum: m/e 377 (M⁺); ¹H NMR (CDCl₃): δ 1.3 (tr, 25 6 H), 1.52-2.18 (m, 4 H), 3.58 (tr, 2 H), 4.09 (qu, 4 H), 5.48 (s. with broad base, 4 H), 7.89 (s, 1 H). Thin layer chromatography on SiGF developed with 5:3 EtOAc:nPrOH gave Rf 0.40.

9(3-ethylphosphono-1-propyloxymethyl)guanine 6-Chloro-9(3-diethylphosphono-1-propyloxymethyl)guanine (75 mg; 0.2 mmol) was combined with 5 ml l N aqueous NaOH and refluxed l hour. The cooled

reaction was neutralized with Dowex 50X8 (pyridinium form) and filtered, rinsing liberally with water. The solution was partially evaporated to remove pyridine and was then lyophilized. The orange-colored residue 5 (74 mg) was redissolved in H₂O and centrifuged to remove insoluble material. The decanted solution (2 ml) was chromatographed on a 0.9 x 46 cm column of Whatman DE-52 Cellulose, HCO3 form, using a linear gradient of one liter each H_2O and $0.2~M~NH_4HCO_3$ after an initial H_2O elution. Fractions (7 ml each) 43-47 10 yielded 25 mg (36%) of fluffy white solid after three lyophilizations. Electron impact mass spectrum (TMS derivative) showed m/1 547 (M+ of TMS derivative); chemical ionization mass spectrum (TMS derivative) showed m/1 548 (M^+ + H of TMS₃ derivative). ¹H NMR (D_2O) showed δ 1.19 (tr, 3 H), 1.4-1.9 (m, 4H), 3.59 (tr, 2 H), 3.90 (quintet, 2 H), 5.47 (s, 2 H), 8.2 (br's, 1 H). Thin layer chromatography behavior on SiGF: Rf 0.40 when developed with 7:3 CH₃CH. 0.1 N aqueous NH₄Cl. The material had a formula of $(C_{11}H_{18}N_5O_5P^*H_2O)$ Calc: C-37.82% H-5.77%, N-20.0. Found: C-38.27%, H-5.84%, N-19.65%. A UV spectum was run on the material and showed UV γ_{max} (ϵ): pH 1, 256 (10, 400), 278 shoulder; pH 7, 252 (11, 300) 271 shoulder; pH 11, 256-258 (9, 600) 267 shoulder. 25 product was relyophilized.

Example III

10

6-Chloro-9(7-diethylphosphono-1-heptyl-methyl)guanine

Diethyl 7-chloromethoxyheptylphosphonate was prepared from 1,7-dibromoheptane and triethyl-phosphite by the procedures used to prepare diethyl 3-chloromethoxypropylphosphonate (Example I). It was reacted with silated 2-amino-6-chloropurine, and mercuric cyanide as described for the preparation of 6-chloro-9(3-diethylphosphono-1-propyloxy-methyl)guanine (Example II) to give 32% of product as

a colorless gum. UV γ_{max} pH 1: 246 nm (ϵ 6220), 310 nm (ϵ 6380); γ_{max} pH 7, 247 nm (ϵ 5910), 310 nm (ϵ 6410); γ_{max} pH 11, 246 nm (ϵ 5950), 309 nm (ϵ 6380); mass spectrum 'H NMR (CDCl₃) f 1.1-1.9 (m, 18 H), 3.48 (t, 2 H), 4.10 (q, 4 H), 5.47 (s, 2 H), 5.88 (s, 2 H), 7.93 (s, 1 H). Thin layer chromatography on silica gel GF gave R_f 0.15 using ethylacetate:ethanol (100:1).

15

9-(7-ethylphosphono-1-heptyloxymethyl)guanine:

6-chloro-9(7-diethylphosphono-1-heptyloxy-methyl)guanine was hydrolyzed by refluxing 1 N aqueous sodium hydroxide for 4 hours and isolated in 30% yield as described for the preparation of 9-(3-ethylphosphono-1-propyloxymethyl)guanine (Example II). It had R_f 0.5 on silica gel GF using acetonitrile (7:3) 0.1 N aqueous ammonium chloride. Proton NMR (D₂ 0) 1.1-1.5 (m, 15 H), 3.5 (t, 2 H), 3.90 (q, 2 H), 5.45 (s, 2 H) UV.

Biological Testing

The compounds of Example I and II were evaluated in vitro as antiviral agents against herpes virus.

of type 1 herpes (thymidine kinase positive virus)
prepared and titered in MA-104 cells and frozen at
-90°C until use.

Continuous passaged monkey kidney (MA-104)

10 cells were used, with growth medium consisting of
Minimum Essential Medium (MEM) supplemented with 0.1%

NaHCO₃ and 9% fetal calf serum. Test medium consisted
of MEM supplemented with 2% fetal bovine serum, 0.18%

NaHCO₃ and 50 µl gentamicin.

The last compounds were added to test medium at a concentration of 2000 $\mu g/ml$ for use as a positive control.

Antiviral Test Method

To a 96 well microtiter plate containing an established 24 hour monolayer of cells from which the 20 medium has been decanted was added 0.1 ml of varying (one-half log10) concentrations of test compound, which incubated on the cell 15 minutes, after which 0.1 ml of virus in a concentration of 320 cell culture 50% infectious doses (CCID50)/0.1 ml was added. plate was covered with plastic wrap and incubated at Included with the test were toxicity controls 37°C. (each concentration of compound + test medium in place of virus), virus controls (virus + test medium in 30 place of compound) and cell controls (test medium in place of compound and virus). The cells were examined microscopically after 72 hours for evidence of cytotoxicity and for viral cytopathic effect (CPE). Vidarabine was run on the same plate in parallel.

Antiviral activity was determined by observation of inhibition of viral CPE. This activity was expressed by minimum inhibitory concentration (MIC), defined as that dose range of compound causing 50% CPE inhibition. A Virus Rating (VR) was also determined, which is a numerical expression of antiviral activity, weighted to take into account any cytotoxicity observed. Generally, a VR of 0.1 - 0.4 is usually indicative of slight antiviral effect, 0.5 - 0.9 indicates moderate antiviral effect, and >1.0 implies strong antiviral activity.

The results of these are summarized in tables A and B. The test compound had a strong activity against the thymidine kinase positive type I herpes virus. The activity was considered equivalent to that of vidarabine.

10

TABLE A

Effect of compound of Example I and Vidarabine on Thymidine Kinase-Positive Type 1 Herpes Virus Infections in MA-104 Cells

	Compound of I_		Vidarabine

^CMinimum inhibitory concentration - that dosage range wherein a 50% CPE inhibition is seen, $\mu g/ml$.

 d_{Maximum} tolerated dose, $\mu g/ml$.

The compound of Example II was further evaluated by the above-described in vitro test method against cytomegalo virus. The compound was strongly active with a VR of 2.1-2.3.

The compound of Example II was tested invivo in guinea pigs as an agent against thymidine kinase positive herpes virus. The animals were innoculated with the virus. Eighteen hours later the material of Example II (0.4% solution in water or 1-2% solution), a 5% solution of acyclovir or a 1.4% 10 solution of poly(vinylalcohol) was administered and five days later blister diameters at the point of innoculation were measured. Satellite lesions were measured as well.

The results of these tests are given in 20 Table C and show that the compound has superior activity against TK+ virus.

Formulations

10

15

30

35

The following formulations based on the compounds of the invention and their preparation are representative.

A formulation suitable for injections intramuscularly or intraperitoneally is prepared by combining the first four of the following materials

Compound of the Invention 1 gram
Poly(ethylene glycol) 50 grams
Propylene glycol 50 grams
Tween 80 suspension agent 1.5 grams
Injectable Saline 200 ml

and then adding the last material. The material forms a clear solution which is filtered and sealed in sterile containers.

A simple intravenous injection formulation is formed by dissolving 1 gram of an active compound in 250 ml of injectable saline which after filtering is packaged in sterile bottles.

A cream for topical administration is formulated by stirring 10 g of active compound of the invention with 20 g of mineral oil, 40 g of petroleum jelly, 0.3 g of mixed methyl/propyl paraben and 5 g of nonionic surfactant at 50°C. Then 150 ml of water are stirred into the mixture at 50°C at high speed to form a cream and the mixture is cooled and packaged in capped tubes.

An oral dosage form is prepared from 10 g of compound of the invention, 100 g of lactose, and 1 g of starch which are mixed with 0.1 g of magnesium stearate in methanol to granulate. The methanol is removed by gentle heating with stirring. A portion of this material is retained as a granular powder for oral use while the remainder is hand formed into 250 mg tablets in a manual tableting machine.

The foregoing examples and formulations have been presented to illustrate the present invention and are not to be construed as limitations on the invention's scope which is instead defined by the following claims.

5

What is Claimed is

1. A compound having the structure

wherein Z_1 and Z_2 are the same or different and selected from the group made up of hydrogen, the one to six carbon alkyls, phenyl and benzyl, X is H, OH, or together with Y = O, Y is H or together with X = O, n is an integer, O, 2 or 4, R_1 and R_2 together complete a β -pentofuranose sugar or R_1 is H and R_2 is H or -CH₂OH, 10 R_3 is H or OH and B is a purine or pyrimidine base.

- 2. The compound of claim 1 wherein ${\rm R}_1$ and ${\rm R}_2$ together complete a 3-pentofuranose sugar.
- 3. The compound of claim 2 wherein B is selected from guanine, adenine, 5-iodouracil, 5-trifluorothymine, 5-iodocytosine, E-5-2-bromovinyluracil, 5-propyluracil and 5-ethyluracil.
 - 4. The compound of claim 2 wherein n is 0.
 - 5. The compound of claim 2 wherein n is 2.
 - 6. The compound of claim 2 wherein n is 4.
- 7. The compound of claim 2 wherein the β -pentofuranose is a β -ribofuranose.

- 8. The compound of claim 2 wherein the $\beta\text{-pentofuranose}$ is a $\beta\text{-arabinofuranose}.$
- 9. The compound of claim 2 wherein Z_1 and Z_2 are each selected from the group made up from hydrogens and one to four carbon alkyls.
 - 10. The compound of claim 9 wherein n is 0.
 - 11. The compound of claim 9 wherein n is 2.
 - 12. The compound of claim 9 wherein n is 4.
- 13. The compound of claim 2 wherein X and Y 10 are each hydrogens.
 - 14. The compound of claim 2 wherein X and Y together are =0.
 - 15. The compound of claim 2 wherein X is hydroxyl and Y is hydrogen.
- 15 16. The compound of claim 1 wherein R_1 is hydrogen and R_2 is hydrogen.
- 17. The compound of claim 16 wherein B is selected from guanine, adenine, 5-iodouracil, 5-tri-fluorothymine, 5-iodocytosine, E-5-2-bromovinyluracil, 5-propyluracil and 5-ethyluracil.
 - 18. The compound of claim 16 wherein \mathbf{Z}_1 and \mathbf{Z}_2 are each selected from the group made up of hydrogen and one to four carbon alkyls.

- 19. The compound of claim 18 wherein X and Y are each hydrogens.
- 20. The compound of claim 18 wherein X and Y together are =0.
- 5 21. The compound of claim 18 wherein X is hydroxyl and Y is hydrogen.
 - 22. The compound of claim 19 wherein n is 0.
 - 23. The compound of claim 19 wherein n is 2.
 - 24. The compound of claim 19 wherein n is 4.
- 10 25. The compound of claim 1 wherein R_1 is hydrogen and R_2 is hydroxymethyl.
- 26. The compound of claim 25 wherein B is selected from guanine, adenine, 5-iodouracil, 5-tri-fluorothymine, 5-iodocytosine, E-5-2-bromovinyluracil, 5-propyluracil and 5-ethyluracil.
 - 27. The compound of claim 25 wherein \mathbf{Z}_1 and \mathbf{Z}_2 are each selected from the group made up of hydrogen and one to four carbon alkyls.
- 28. The compound of claim 27 wherein X and Y 20 are each hydrogens.
 - 29. The compound of claim 27 wherein X and Y are =0.

30. The compound of claim 27 wherein X is hydroxyl and Y is hydrogen.

5

- 31. The compound of claim 28 wherein n is 0.
- 32. The compound of claim 28 wherein n is 2.
- 33. The compound of claim 28 wherein n is 4.
 - 34. A metal salt of a compound of claim 1.
- 35. A pharmaceutical preparation comprising a compound of claim 1 in a pharmaceutically acceptable carrier.
- 36. A method for treating herpes in a mammal in need of such treatment comprising administering to said mammal an effective herpes-treating dose of the preparation of claim 35.

V. OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE 10	· · · · · · · · · · · · · · · · · · ·
This international search report has not been established in respect of certain claims under Article 17(2) (a) f 1. Claim numbers	
· · · · · · · · · · · · · · · · · · ·	othonsy, namely.
2. Claim numbers, because they relate to parts of the international application that do not comply	with the prescribed require-
ments to such an extent that no meaningful international search can be carried out 13, specifically:	
·	
VI. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING 11	•
This International Searching Authority found multiple inventions in this International application as follows:	
- claims 1-8,34-36 } For explanation: see Form POT/ISA	/210
- claims 1-8,34-36 For explanation: see Form PCT/ISA supplemental she	7210 et 3
- claims 9-36)	-
1. As all required additional search fees were timely paid by the applicant, this International search report of the International application.	overs all searchable claims
2. As only some of the required additional search fees were timely paid by the applicant, this international those claims of the international application for which fees were paid, specifically claims:	search report covers only
most claims of the international appropriation for which lees were paid, specifically claims:	
3. No required additional search fees were timely paid by the applicant. Consequently, this international se	arch report is restricted to
the invention first mentioned in the claims; it is covered by claim numbers;	
A D As all searchable states sould be searched without affine institutes an additional for the search at the searc	Sanahina A akan akan a
4. As all searchable claims could be searched without effort justifying an additional fee, the International Sinvite payment of any additional fee.	searching Authority did not
Remark on Protest The additional search fees were accompanied by applicant's protest.	
No protest accompanied the payment of additional search fees.
